NCCP 00525 · VERSION 6

Ribociclib + endocrine therapy · metastatic

The usual metastatic starting dose is ribociclib 600 mg once daily on Days 1–21 followed by Days 22–28 off. Continue the prescribed AI daily or fulvestrant on its own injection schedule; add ovarian suppression when indicated. Continue while beneficial and tolerated.

Your treatment and review passport

Bring this to reviews. Record symptoms, treatment changes and questions when helpful. You do not need to complete a daily diary or calculate a toxicity grade.

The four sheets are reusable review periods, not a prescribed number of cycles. Follow the treatment and rest days agreed with your team; do not calculate a restart from this sheet.

These patient-language prompts are not a validated questionnaire or a formal CTCAE assessment. Urgent symptoms override the form.

Emergency: 112 / 999. Severe chest pain, major breathing difficulty, collapse or stroke symptoms need emergency help.

Contact your treating team promptly: Report new breathlessness, chest symptoms, severe diarrhoea, inability to drink, jaundice, a painful swollen leg or a severe rash promptly. You do not need to identify which medicine caused the symptom.
