Adult treatment scope · NCCP 00702a / 00702b This adult suite covers entrectinib alone for ROS1-positive advanced NSCLC before any ROS1 inhibitor (00702a), or a separate NTRK gene-fusion solid-tumour indication with no previous NTRK inhibitor and no satisfactory treatment options (00702b). Molecular tests and Irish access criteria must be confirmed. The adult 600 mg schedule does not apply to children.

NCCP 00702 · VERSION 2

Entrectinib monotherapy · adult

The usual adult starting dose is 600 mg by mouth once daily, every day without a planned rest week. Use your prescribed dose. Treatment continues while helping and side effects remain acceptable; there is no fixed number of cycles.

Your treatment and review passport

Bring this to reviews. Record symptoms, treatment changes and questions when helpful. You do not need to complete a daily diary or calculate a toxicity grade.

The four sheets are reusable review periods, not a prescribed number of cycles. Follow the treatment and rest days agreed with your team; do not calculate a restart from this sheet.

These patient-language prompts are not a validated questionnaire or a formal CTCAE assessment. Urgent symptoms override the form.

Emergency: 112 / 999. Severe chest pain, major breathing difficulty, collapse or stroke symptoms need emergency help.

Contact your treating team promptly: Call the oncology team urgently for new or worsening breathlessness, swelling, palpitations or fainting; marked confusion or memory change; fever, jaundice, severe diarrhoea or inability to drink. Report new visual disturbance and focal bone pain promptly. Follow your unit’s temperature/contact instructions. Severe breathing difficulty, chest pain or collapse needs emergency help.
